

Graduate Studies in Physics at the University of Mississippi

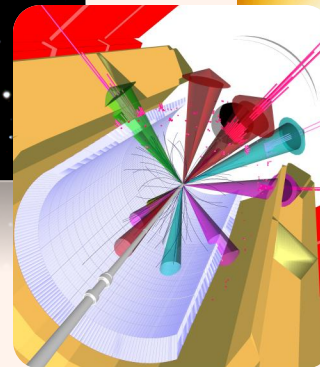

- Faculty: 14
- Including Research Faculty: 35
- Graduate students: 23
- Major Research Areas
 - Physical Acoustics
 - Gravity
 - Condensed Matter
 - High Energy
 - Atmospheric

Physics Research at U of M

Research Area	Number of Faculty	Number of Active Grants	2009 Expenditures
Atmospheric	2	1	\$108k
Gravity (LIGO)	3	5	\$750k
High Energy	4	6	\$1,880k
Condensed Matter/ Physical Acoustics	11	3	\$440k
	25	40	\$10,000k **

** includes all of NCPA research

Path to a Ph.D.

- 54 credit hours
(3 out of dept.)
- Preliminary exam (1st year)
- Defense of a Prospectus
(thesis proposal)
- Defense of a Thesis
- Typical time:
 - ~ 5 years for theory
 - ~ 6 years for experiment

U of M Physics Facilities

- National Center for Physical Acoustics
- 2 machine shops with 5 machinists.
- Computing Farm
 - 160 compute nodes
 - 320 GB memory + 8 TB storage
- Kennon Observatory
- Electronics shop (NCPA).

University of Mississippi – Physics and Astronomy A review paper on resonant ultrasound spectroscopy in high temperature environments has recently been published by J.R. Gladden (faculty) and Guangyan Li (recent Ph.D. graduate). It can be found in the International Journal of Spectroscopy Vol. 2010, article ID: 206362, doi:10.1155/2010/206362. The link is: <http://www.hindawi.com>

High Temperature Resonant Ultrasound Spectroscopy: A Review
www.hindawi.com

The measurement of elastic constants plays an important role in condensed matter physics and materials characterization. This paper presents the resonant ultrasound spectroscopy (RUS) method for the determination of elastic constants in a single crystal or amorphous solid. In RUS, the measured reso

Experimental gravitational astrophysics

Ole Miss is an institutional member of the **Laser Interferometer Gravitational-wave Observatory (LIGO)** Scientific Collaboration.

LIGO searches for **gravitational waves**, the “ripples in space-time” predicted by **Einstein’s theory of relativity**.

LIGO is the major experiment funded by the **National Science Foundation**. The Ole Miss LIGO group was awarded **over \$1.2M** in the past three years to support **students** and do **research** on gravitational astrophysics.

More information at <http://ligo.phy.olemiss.edu> or email cavaglia@olemiss.edu

Theoretical gravitational astrophysics

<http://www.phy.olemiss.edu/GR/>

When massive stars die, they become black holes or “neutron stars”:
small “stellar lighthouses” that we observe as pulsars

We also see gigantic black holes in galaxies
When galaxies merge, so do these black holes!

**According to Einstein’s theory, the strongest gravitational waves
will come from the “death cry” of merging black holes and neutron stars**

These “death cries” will tell us a lot about the Universe:

- 1) Was Einstein right?
- 2) What is the state of matter inside a neutron star?
- 3) How were black holes born? How did they grow?
- 4) How did the Universe become what it is today?

The University of Mississippi

Neutrino Physics

- A neutrino is an elementary particle that is electrically neutral, and has a nonzero tiny mass. There are many sources of neutrinos such as solar, atmospheric, supernova, and reactor neutrinos. Here, the Sun as seen in neutrinos by the Super Kamiokande expt.

Trillions of neutrinos pass through our body every second because neutrinos are weakly interacting.

- Neutrino detectors all around the world are trying to study the neutrino properties. In 1998, research results at the Super-Kamiokande neutrino detector determined that neutrinos do indeed flavor oscillate, and therefore have mass.

The big **B meson**

- .CP violation: All matter have anti-matter. CP violation causes differences in matter anti matter properties.
- .CP violation is one of the necessary conditions to explain the matter-antimatter asymmetry in the universe after the Big Bang.
- . B mesons are mesons composed of a heavy bottom quark and a light antiquark quark.
- . B mesons are excellent source to explore the CP violation.

LHCb @LHC

• A Large Hadron Collider Beauty Experiment is dedicated to the Precision Measurements of CP-Violation and Rare Decays.

• LHCb Collaboration: 14 countries, 47 institutions, ~600 people

Atmospheric Physics at the University of Mississippi

Faculty:

Dr. Thomas Marshall, Professor (marshall@olemiss.edu)

Dr. Maribeth Stolzenburg, Research Associate Professor (mstolzen@olemiss.edu)

Current Graduate Student:

Mr. Sumedhe Karunarathne

Recent Ph.D. Students:

Dr. Baishali Ray, Ph.D. (May 2010). Now teaching at Young Harris College, GA.

Dr. Chris Maggio, Ph.D. (Dec. 2007). Now teaching at Mississippi College, MS.

Current Projects:

- observational studies of lightning initiation and propagation – acquisition and analysis of data from multiple platforms at multiple electromagnetic frequencies, along with high-speed video data, from three field campaigns (2009-2011) at KSC.
- modeling the contribution of thunderstorms and lightning in the Earth's global electric circuit.
- continued data analyses of the electrical evolution, precipitation structure, and lightning development in New Mexico mountain thunderstorms.

Some Recent Media Coverage of our Research:

- featured in an upcoming “Field Notes” column by Dava Sobel in *Discover Magazine*.
- interviewed for the “Lightning” portion of *Science Storms*, a new permanent exhibit at The Museum of Science and Industry in Chicago.

Atmospheric Physics at UM (*continued*)

Condensed Matter Physics

Research

- High temperature and pressure resonant ultrasound spectroscopy (thermoelectrics, metallic hydrides, layered ceramics,...)
- Acoustic and flow properties of viscoelastic fluids
- Granular dynamics in a vortex flow
- Multidomain ferroelectric transducers and cantilevers

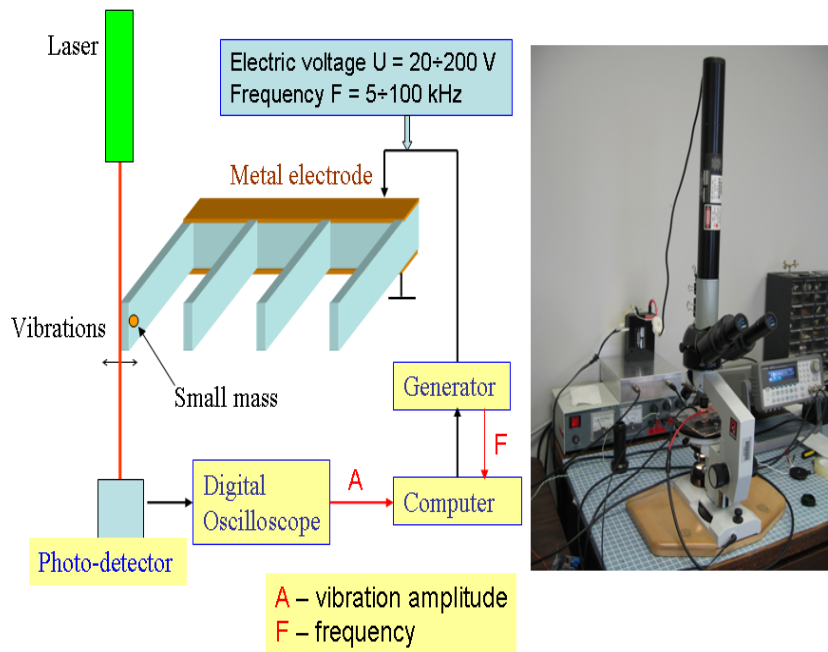

People

- Faculty: J.R. Gladden, I. Ostrovskii, N. Ostrovskaya
- Students: Rasheed Adebisi, Sumudu Tennakoon, David Sedarook, Trey Lyons

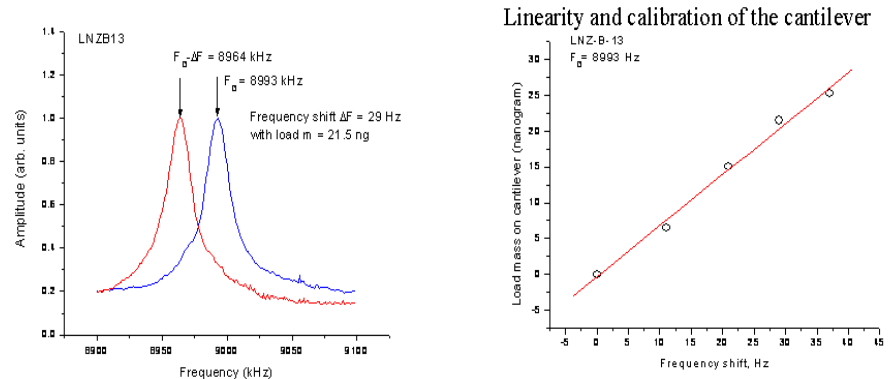

Nanoscience: Multidomain Ferroelectric Cantilever for Pico-gram mass Detection.

Applications: Detection and Identification of Protein Molecules (including those in air or water).

Experimental setup: Excitation and Detection of the Acoustic Vibrations

RESULTS: Measurements from fabricated cantilevers

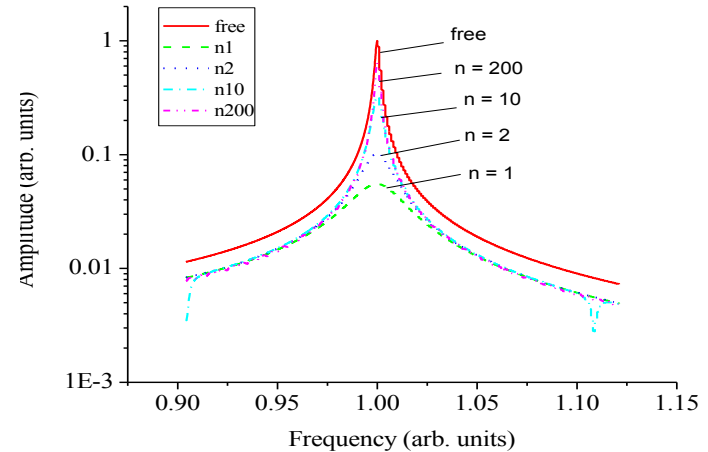

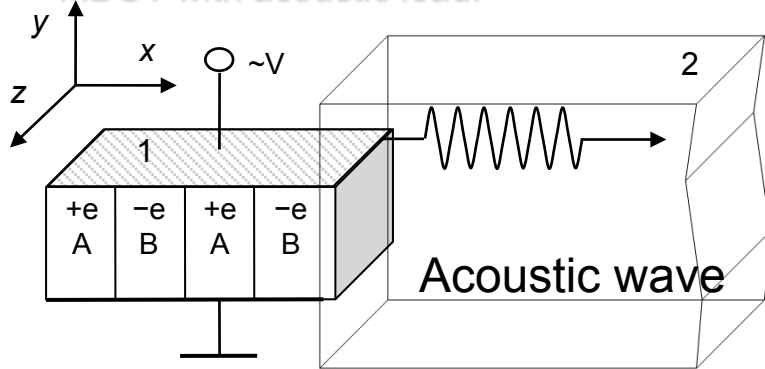

Small masses – paraffin spherical peaces
 $D = 5-50\ \mu$ and $M = 0.1-60\text{ ng}$

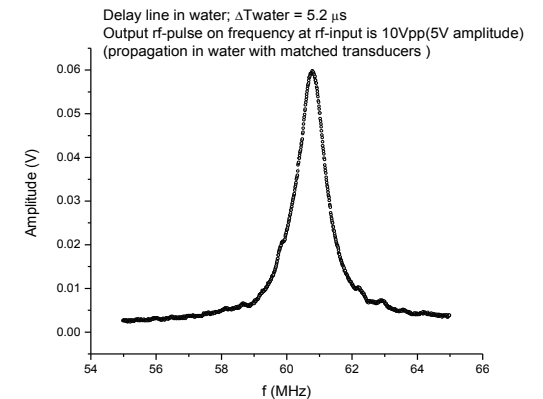

100 pg or 10^{-10} g is the smallest mass measured in our experiments

NEW Multi-Domain Ultrasonic Transducers (MDUT)

- We fabricated MDUTs based on LiNbO_3 and LiTaO_3 .
- MDUT with acoustic load:

60 MHz MDUT: Lab prototype, LTZA17a, b (98 m domain period)

- Multi-Domain ultrasonic transducer is developed and **patented**.
- Lab models of LiNbO_3 and LiTaO_3 MUTs are fabricated
- Analytical theory is developed for 2D MDUT
- Theory is in a good agreement with the experiments
- Applications of MUT are for Ultrasonics and Medicine.

$$U_n(\omega) = V \frac{e_{21}}{c_{11}^E} \frac{d}{h} \frac{1}{\gamma d} \frac{\text{Tanh}\left(\frac{\gamma d}{2}\right)}{1 + Z \cdot \text{Coth}(n \gamma d)}$$

Wind Noise Program

Richard Raspet—Professor

Jeremy Webster—R&D Engineer

Kevin Dillion—Masters

Jiao Yu—Masters and Ph.D.

JohnPaul Abbott—Masters, current Ph.D. student

- Program:
- Develop theories for wind noise measured outdoors
 - Relate measured wind and wind turbulence to pressure measurements

From no quantitative theories in the literature when the University started this research program to theories for:

- Spherical wind screens
- Streamlined probes
- Intrinsic pressure fluctuations above the ground and at the surface

Publications:

R. Raspet, J. Webster, and K. Dillion. "Framework for wind noise studies," *J. Acoust. Soc. Am.* **119**, 834 (2006).

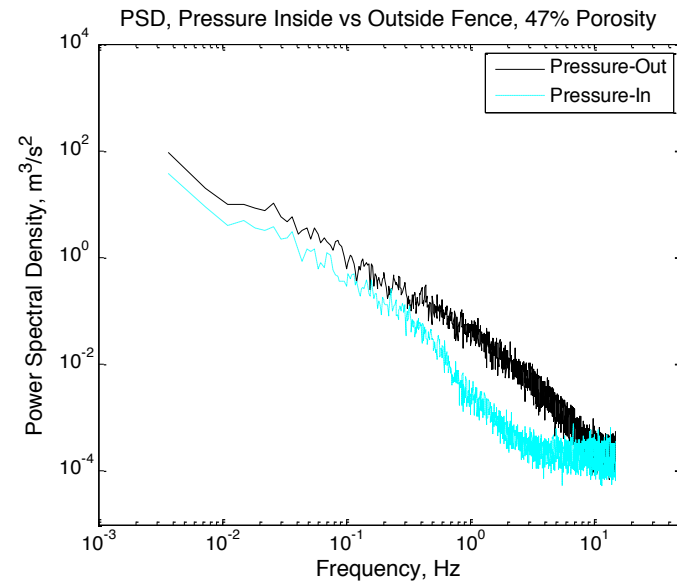

R. Raspet, J. Webster, and J. Yu. "Low frequency wind noise contributions in measurement microphones," *J. Acoust. Soc. Am.* **123**, 1260 (2008).

J. Webster, R. Raspet, J. Yu, and W. Prather, "Measurement of wind noise levels in streamlined probes," *J. Acoust. Soc. Am.* **127**, 2764 (2010).

J. Yu, R. Raspet, J. Webster, and J. Abbott, "Wind noise measured at the ground surface," (accepted for publication, *J. Acoust. Soc. Am.*)

New Work

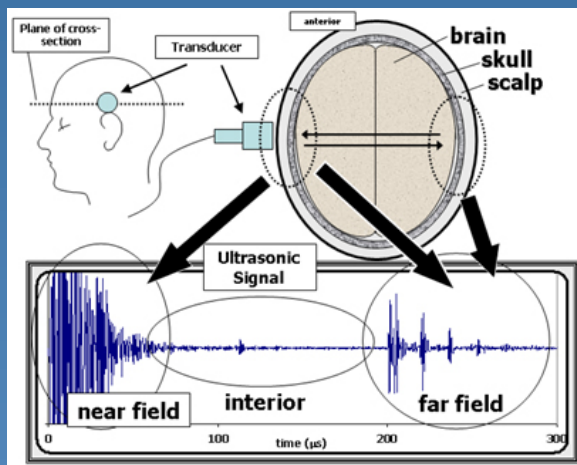

Large screens for infrasound and long range sound propagation

Next: - Wind noise under trees
- Radiation

Biomedical Ultrasound

- Detection of brain trauma
- Remote ultrasonic surgery
- High-intensity fields
- Diagnostic applications

atmospheric propagation, laser
vibrometry, underwater acoustics

Physics, Chemistry, Biology, Engineering, ...

BASS Program

- Eight week summer research program for undergraduates
- Work directly with staff scientists and engineers at NCPA

NATIONAL CENTER FOR PHYSICAL ACOUSTICS
THE UNIVERSITY OF MISSISSIPPI

Henry E. Bass Basic Acoustics Summer School at Ole Miss

PURPOSE: The purpose of the Henry E. Bass Basic Acoustics Summer School (BASS) is to bring undergraduate students, distinguished Research Scientists of the National Center for Physical Acoustics (NCPA), and Discussion Leaders together to explore a wide variety of topics in physical acoustics and engineering. BASS will give students opportunities to do research directed by experts, exploring topics that are not ordinarily encountered in the undergraduate experience.

STUDENTS: The focus of BASS is on intermediate and advanced undergraduate students (must have completed sophomore year). Participation is limited to three undergraduate students.

RESEARCH PARTICIPATION: Each student will be assigned a research advisor and a research topic for the program. The student is expected to be working in the lab during the normal 8:00 – 5:00 business day when not in organized lectures and discussion groups. Full-time participation of all is required.

COSTS: Participants provide their own transportation to and from The University of Mississippi. There is no registration fee. Participants will receive a \$2500 stipend and are responsible for housing and meals. If a participant prefers to stay on campus dormitory rooms and meal plans may be secured through The University of Mississippi (details will be provided with the application packet).

PROGRAM: The Program will be held June 6, 2011 – July 29, 2011. Program information including a full Preliminary Schedule will be provided to all those who request the Application Forms.

Complete applications for the 2011 Summer School must be received no later than 15 April 2011.

Application Packets may be requested from:
Dr. Sara Davis Brown
National Center for Physical Acoustics
The University of Mississippi
University MS 38677-1848
Phone (662) 915-6547
E-mail: sarad@olemiss.edu

2010 Student Projects

Properties of Wormlike Micelles

- Non-Newtonian rheology
- Viscoelastic
 - Shear wave propagation is supported by fluid drag due to viscosity
 - Internal structures (surfactant aggregates) of the fluid support elasticity
 - Long relaxation time
- Birefringent
 - Using cross polarized lenses, shear wave propagation is observed

Ultrasonic Field via Hydrophone

Motivation
Experiment
Results
Summary

Overview
Experimental Setup
Instrumentation

Wing Design: Final Product

Step 1: Fourier Transform

$$\hat{U}_0(k_x, k_y, z_0) = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} U_0(x, y, z_0) e^{i(k_x x + k_y y)} dy dx$$

Step 2: Propagate using kernel derived from Helmholtz eq.

$$\hat{U}_z(k_x, k_y, z) = \hat{U}_0(k_x, k_y, z_0) e^{i(z-z_0)k_z(k_x, k_y)}$$

Step 3: Inverse Fourier transform

$$U_z(x, y, z) = \frac{1}{(2\pi)^2} \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} \hat{U}_z e^{i(k_x x + k_y y)} dk_x dk_y$$

Inaugural Class 2010

The Acoustic Spectrum

Research at NCPA

Infrasound

Remote detection of high energy atmospheric events
Wind filters for infrasonic transducers

Sound

Vibrations in aerospace structures
Jet noise
Aquaculture
Laser vibrometry
Atmospheric propagation

Ultrasound

Materials characterization
Resonant spectroscopy
Highly dispersive structures
Biomedical applications
