

PHYS 315 EXAM I**9/20/05**

*Place your answers in the spaces provided. You must show your work for full credit.
10 pts each.*

#1- How fast must a meter stick be moving if it's length is observed to shrink to 0.5 m?
Express your answer relative to the speed of light

$$\begin{aligned} L &= L_0 / \gamma \\ \gamma &= 0.5 = \sqrt{1/\gamma^2} \\ \beta^2 &= 1 - 1/\gamma^2 = 0.75 \\ \beta &= 0.87 c \end{aligned}$$

$$v = \text{_____} c$$

#2- Calculate how fast you are going in when you pass through a red light ($\lambda=650\text{nm}$) and it appeared green($\lambda=570\text{nm}$) to you.

$$v = \text{_____} \text{ m/s}$$

$$\begin{aligned} 650/570 &= (1 + \beta / 1 - \beta)^{1/2} \\ (1.14)^2 &= 1.3 = 1 + \beta / 1 - \beta \\ 1.3 - 1.3\beta &= 1 + \beta \\ 2.3\beta &= 0.3 \\ \beta &= 0.13 c \quad v = 3.9e7 \text{ m/s} \end{aligned}$$

#3- Protons at Fermi National Laboratory are accelerated to 400 times their rest energy. What is the speed of these protons relative to the speed of light?

$$\gamma = 400$$

$$\beta = 1 - 1/\gamma^2 = 0.99999375...$$

$$v \sim c$$

$$v = \text{_____} c$$

What is their kinetic energy in MeV?

$$T = \text{_____} \text{ MeV}$$

$$E = 400 Mc^2$$

$$T = E - Mc^2 = 399 Mc^2$$

$$T = \sim 399 (939 \text{ MeV}) = 374660 \text{ MeV}$$

#4- How much energy is released in **one kilogram** of $^{236}\text{U}_{92}$ through the the decay
 $^{236}\text{U}_{92} \rightarrow ^{90}\text{Rb}_{37} + ^{143}\text{Cs}_{55} + 3\text{}^1_0\text{n}$.

$$M(U) = 236.045563 u$$

$$M(Rb) = 89.914811 u$$

$$M(Cs) = 142.927220 u$$

$$\Delta E = \text{_____} \text{ MeV}$$

$$\Delta mc^2 = \{236.045563u - 89.914811u - 142.927220u - 3(1.009)u\} c^2$$

$$= \{0.177532 u\} c^2 = 165.4 \text{ MeV per atom}$$

$$N = (1000\text{g}/236) \text{ moles} \times 6.02\text{e}23 = 2.55\text{e}24 \text{ atoms}$$

$$\Delta E = (2.55\text{e}24 \text{ atoms}) (165.4 \text{ MeV/atom})$$

$$\Delta E = 4.22\text{e}26 \text{ MeV}$$

See Example 2.7

#5- A sodium vapor lamp has a power of 10 W. Using $\lambda = 589.3 \text{ nm}$ as the average wavelength of the source, calculate the number of photons emitted per second.

$$N/s = \underline{\hspace{2cm}}$$

$$N/s = P/hf = 10 \text{ W} / 3.37\text{e-}19 \text{ J} = (10\text{W}/3.37\text{e-}19 \text{ J})$$

$$N/s = 2.97\text{e}19 \text{ 1/s}$$

$$hf = hc/\lambda = 1240/589.3 = 2.1 \text{ eV} = 3.37\text{e-}19 \text{ J per photon}$$

#6- When Cesium metal is illuminated with light of wavelength 300nm the photoelectrons emitted have a maximum kinetic energy of 2.23 eV. Find the work function of cesium.

$$\phi = \underline{\hspace{2cm}} \text{ eV}$$

$$hf = 1240/300 \text{ eV} = 4.13 \text{ eV}$$

$$KE_{\text{max}} = hf - \phi$$

$$\phi = hf - KE_{\text{max}} = (4.13 - 2.23) \text{ eV}$$

$$\phi = 1.9 \text{ eV}$$

What is the stopping voltage V_s when $\lambda=400\text{nm}$ light is incident?

$$V_s = \underline{\hspace{2cm}} \text{ V}$$

$$hf = (1240/400) \text{ eV} = 3.1 \text{ eV}$$

$$eV_s = hf - \phi = (3.1 - 1.9) \text{ eV}$$

$$eV_s = 1.2 \text{ eV}$$

$$V_s = 1.2 \text{ V}$$

#7- A 10 KeV X-ray Compton scatters in a Pb shield giving the electron a maximum of kinetic energy. Determine the kinetic energy of the Compton electron. (*What photon scattering angle gives the maximum energy transfer?*)

$$KE_e = \text{_____ eV}$$

$$\lambda_o = 1240 / 10000 \text{ eV} = 0.124 \text{ nm}$$

$$\lambda = \lambda_o - (0.00243 \text{ nm})(1 - \cos\theta) = 0.124 + 0.00486 \text{ nm} = 0.129 \text{ nm}$$

$$\theta = 180^\circ \text{ for maximum energy transfer to the electron (Compton backscatter)}$$

$$hf_o = hc/\lambda_o = 1240 / 0.124 = 10000 \text{ eV}$$

$$hf = hc/\lambda = 1240 / 0.129 = 9612 \text{ eV}$$

$$K_e = hf_o - hf$$

$$K_e = 388 \text{ eV}$$

#8 – An electron in hydrogen makes a transition from an n=3 state to an n=1 state without emitting a photon. Instead an n=2 electron is ejected by the Auger process. Find the kinetic energy of the emitted Auger electron. Draw the energy level diagram.

$$KE_e = \text{_____ eV}$$

$$E_n = -13.6 \text{ eV}$$

$$E_1 = -13.6 \text{ eV}$$

$$E_2 = -3.4 \text{ eV}$$

$$E_3 = -1.51 \text{ eV}$$

$$E_{13} = E_3 - E_1 = 12.1 \text{ eV}$$

$$E_e = E_{13} - I = 12.1 \text{ eV} - 3.4 \text{ eV}$$

$$E_e = 8.7 \text{ eV} \quad (\text{Auger Electron})$$
