1. What is the objective of this experiment? 1 pt.

2. What is centripetal acceleration and centripetal force? Give equation and an explanation. 2 pts.

3. In step 3 of lab procedure, is the weight hanging greater than, less than or equal to the centripetal force determined in step 7 of procedure? Explain. 2 pts.

4. Given the following information, determine centripetal force $F_c$. In a 2 minute interval, a bob with mass 150g rotates with a radius of 55 mm for a total of 900 revolutions. See steps 5, 6 and 7 of lab procedure. 2 pts. Show work.

5. Create a data table for this experiment 3 pts.
